

Version 186

What's new

Newly added features:

Added info line in dashboard notifying when new firmware version is available

New improvements on existing features:

- Improved sunset / sunrise scenario (Before sunset & After sunset)
- Improved controller log file backup from weekly to daily
- Improved room functionality while saving
- Improved filter option of units in Units tab
- Better position accuracy in mobile in dynamic scenario “view all”

Added info line in dashboard notifying when new firmware version is available

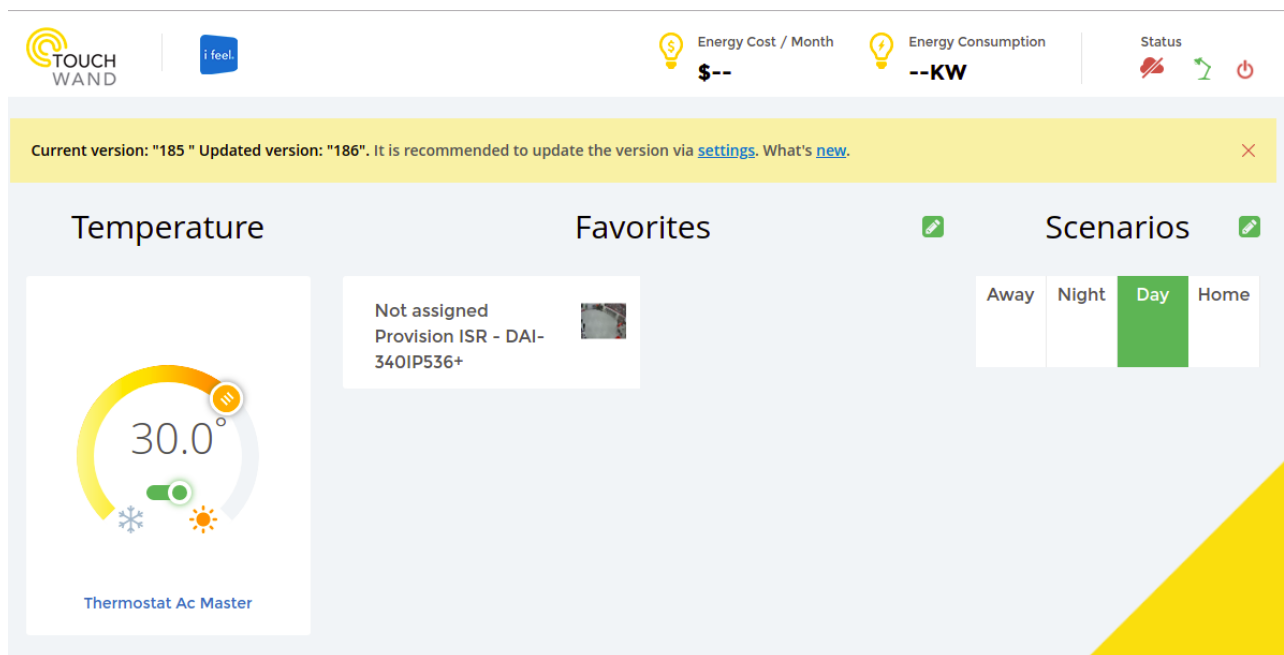

Upon new controller's firmware version released, the Dashboard page after login will display notification at header of the application.

To review the what's new in updated version, press the "new" link at the end of the line.

To update press "settings" link in the line and it will pop you to the tab "settings / firmware update" where you will be able to update the firmware.

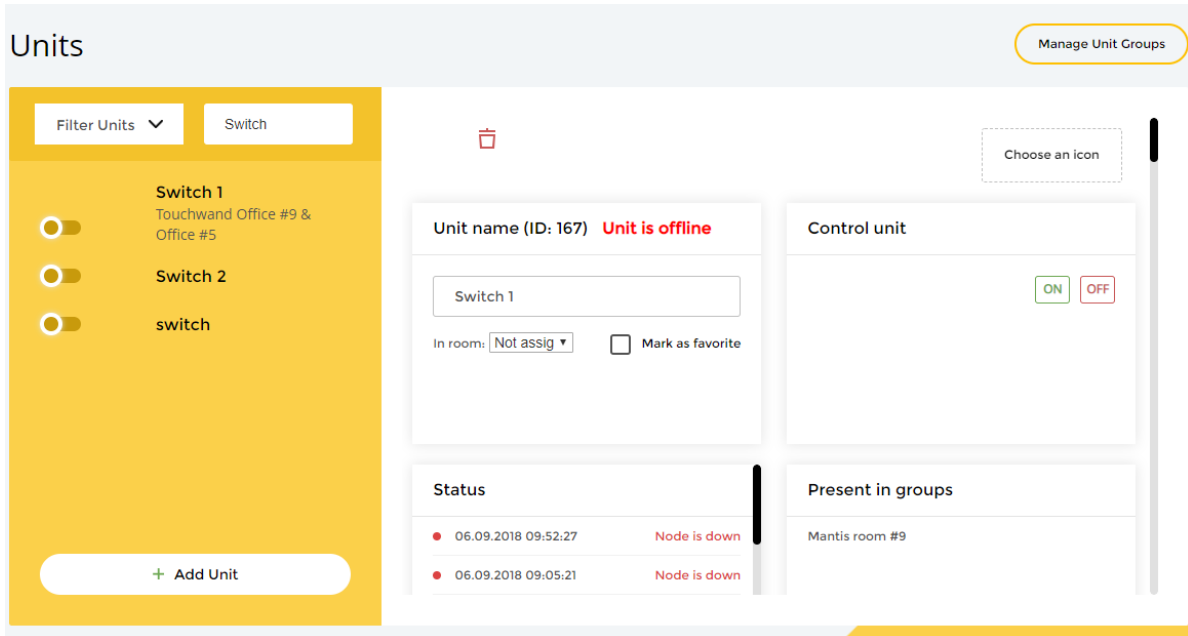

The update process may take few minutes while during this time the controller connects to the cloud and download the update and update the firmware and last step will be restart of the controller.

It is recommended to update to new version that includes new features and bugs fixes and improvements.

Improved filter option of units in Units tab

In the Units tab, possibility to filter the units by their names is improved. For example, if the name 'switch' is entered, all units that contain the name "switch" will be filtered in the units' list.

if the name 'Switch 1' is entered, unit that has the name Switch1 will be visible.
